

Daily Sales Trends Across All Products

The retail dataset spans from **January 2023 to January 2024** with 345 distinct days of sales data. Daily sales show significant variability, ranging from as low as \$30 to peaks exceeding \$5,000, with all three product categories contributing to the overall trends.

Key Observations

Sales Volatility: The chart reveals substantial day-to-day fluctuations in revenue across all categories, with no clear seasonal pattern. Electronics, Clothing, and Beauty each experience intermittent spikes, suggesting sales are driven by individual high-value transactions rather than consistent daily volume.

Category Performance: All three product categories contribute relatively evenly to daily sales, with no single category consistently dominating. The overlapping lines indicate that different categories peak on different days, creating a balanced but unpredictable sales pattern throughout the year.
